

## **GHOSTD Corporation Identity Governance Program – Phase 1 Foundation**

### **1. Executive Summary**

Implemented the identity foundation for GHOSTD Corporation in Microsoft Entra ID. Created a governance-ready tenant with **26** users, **11** security groups, **9** enterprise applications, role-based group memberships, manager relationships, and identity attributes required for Joiner-Mover-Leaver and Identity Governance workflows.

### **2. Business Requirement**

GHOSTD Corporation needed a centralized identity foundation to manage employee access by department, job role, employee type, and application need. The goal was to reduce manual access assignment, establish least privilege, and prepare the tenant for access reviews, entitlement management, lifecycle workflows, and privileged access management.

### **3. Scope Completed**

| <b>Area</b>          | <b>Completed</b>                                        |
|----------------------|---------------------------------------------------------|
| Tenant configuration | Yes                                                     |
| User provisioning    | 26 users                                                |
| Security groups      | 11 groups                                               |
| Enterprise apps      | 9 apps                                                  |
| Group memberships    | Completed                                               |
| User attributes      | Department, job title, employee type, manager, location |
| RBAC model           | Implemented                                             |

## 4. Implementation Steps

### Step 1 – Tenant Configuration

#### What Was Done:

Created and configured the GHOSTD Corporation Microsoft Entra tenant to serve as the identity platform for the organization. Verified tenant configuration, administrative access, and organizational structure readiness.

#### Why It Matters:

Every IAM program begins with a centralized identity source. The tenant serves as the authoritative directory for users, groups, applications, governance policies, and access controls. Establishing a properly configured tenant is the foundation for Identity Governance capabilities.

**Evidence:** The screenshot shows:

- GHOSTD Corporation tenant
- Microsoft Entra environment
- 26 users
- 11 groups
- 9 enterprise applications
- Administrative access established

### Step 2 – User Provisioning

### What Was Done:

Provisioned 25 mock employees plus one administrative account using standardized naming conventions and identity attributes. User records include employee IDs, job titles, departments, managers, locations, and employee types.

### Why It Matters:

Identity Governance relies on accurate identity data. User attributes drive automated access decisions, dynamic group membership, lifecycle workflows, entitlement assignments, and access review campaigns.

### Evidence:

The screenshot shows:

- 26 active user accounts
- Standardized naming convention
- Employee identities created within Microsoft Entra ID
- Organizational user population successfully onboarded

## Step 3 – Security Group Architecture

### What Was Done:

Designed and implemented role-based security groups aligned to organizational departments and access requirements.

Groups created include:

- All Employees
- Executive Leadership
- HR Team
- Finance Team
- Engineering Team
- Marketing Team
- Sales Team
- IT Team
- IT Admins
- GitHub Developers
- Contractors

### Why It Matters:

Security groups are the foundation of Role-Based Access Control (RBAC). Group-based access reduces administrative overhead and supports least-privilege access management.

### Evidence:

The screenshot shows:

- 11 security groups
- Department-based group structure
- Privileged access groups
- Contractor access segmentation
- Governance-ready RBAC design

## Step 4 – User Object Validation

The screenshot displays the Microsoft Entra admin center interface. The left sidebar shows the navigation menu with options like Home, Security Copilot agents, Security Copilot chat, Favorites, and a list of categories including Entra ID, Groups, Devices, Agents, Enterprise apps, App registrations, Roles & admins, and Delegated admin partners. The main content area shows the user profile for Daniel Brooks, with tabs for Overview, Monitoring, and Properties. The Properties tab is active, showing various attributes organized into sections: Identity, Contact Information, Parental controls, Settings, and On-premises. The Identity section includes fields like Display name, First name, Last name, User principal name, Object ID, Identities, User type, Creation type, Created date time, Assigned licenses, Preferred language, Sign in sessions valid from date, Last password change date time, Invitation state, External user state change date time, Password policies, Password profile, and Authorization info. The Contact Information section includes Street address, City, State or province, ZIP or postal code, Country or region, Business phone, Mobile phone, Email, Other emails, Proxy addresses, Fax number, and IM addresses. The Job Information section includes Job title, Company name, Department, Employee ID, Employee type, Employee hire date, Employee org data, Office location, Manager, and Sponsors. The Settings section includes Account enabled, Usage location, Preferred data location, and On-premises sync enabled. The On-premises section includes On-premises last sync date time, On-premises distinguished name, Extension attributes, On-premises immutable ID, On-premises provisioning errors, On-premises SAM account name, On-premises security identifier, On-premises user principal name, and On-premises domain name.

| Section             | Attribute                       | Value                              |
|---------------------|---------------------------------|------------------------------------|
| Identity            | Display name                    | Daniel Brooks                      |
|                     | First name                      | Daniel                             |
|                     | Last name                       | Brooks                             |
|                     | User principal name             | Daniel.Brooks@camjohnson7...       |
|                     | Object ID                       | 6a7b405a-a405-4cd2-a8a7-6...       |
|                     | Identities                      | camjohnson78outlook.onmicrosoft.co |
|                     | User type                       | Member                             |
|                     | Creation type                   |                                    |
|                     | Created date time               | Jun 16, 2026, 4:45 PM              |
|                     | Assigned licenses               | <a href="#">View</a>               |
| Contact Information | Street address                  |                                    |
|                     | City                            |                                    |
|                     | State or province               |                                    |
|                     | ZIP or postal code              |                                    |
|                     | Country or region               |                                    |
| Job Information     | Job title                       | Finance Manager                    |
|                     | Company name                    | GHOSTD Corp.                       |
|                     | Department                      | Finance                            |
|                     | Employee ID                     | GHC004                             |
|                     | Employee type                   | Full-Time                          |
| On-premises         | On-premises sync enabled        | No                                 |
|                     | On-premises last sync date time |                                    |
|                     | On-premises distinguished name  |                                    |
|                     | Extension attributes            |                                    |
|                     | On-premises immutable ID        |                                    |
|                     | On-premises provisioning errors |                                    |
|                     | On-premises SAM account name    |                                    |
|                     | On-premises security identifier |                                    |
|                     | On-premises user principal name |                                    |
|                     | On-premises domain name         |                                    |

### What Was Done:

Validated identity attributes for employee records including department, manager, job title, employee type, employee ID, office location, and account status.

### Why It Matters:

Identity Governance platforms rely on user attributes to automate access assignments and lifecycle decisions. Accurate user profiles are critical for governance automation.

### Evidence:

The screenshot shows:

- Employee profile for Daniel Brooks
- Department attribute
- Manager relationship
- Employee ID

- Job title
- Employee type
- Office location
- Active account status

## Step 5 – RBAC Membership Validation

### What Was Done:

Assigned users to business-aligned security groups according to job responsibilities and access requirements. Validated Finance Team membership against the employee access matrix.

### Why It Matters:

RBAC ensures users receive access based on job function rather than individual assignment. This improves scalability, reduces access errors, and supports auditability.

### Evidence:

The screenshot shows:

- Finance Team security group
- Daniel Brooks (Finance Manager)
- Emma Collins (Accountant)
- Lucas Price (Payroll Specialist)
- Avery Simmons (Finance Contractor)

Membership aligns with documented business access requirements.

## Step 6 – Enterprise Application Inventory

The screenshot shows the Microsoft Entra admin center interface. The left sidebar contains navigation options like Home, Security Copilot agents, Security Copilot chat, Favorites, Entra ID, Overview, Users, Groups, Devices, Agents, Enterprise apps, App registrations, Roles & admins, and Delegated admin partners. The main content area is titled 'Enterprise applications | All applications' for the GHOSTD Corporation. It includes an Overview section with instructions on how to view, filter, and search applications. Below this is a table listing 9 applications found, filtered by 'Enterprise Applications'. The table columns are Name, Object ID, Application ID, Homepage URL, Created on, and Activation status. All applications are listed as 'Activated'.

| Name              | Object ID             | Application ID        | Homepage URL              | Created on | Activation status |
|-------------------|-----------------------|-----------------------|---------------------------|------------|-------------------|

### What Was Done:

Created and configured enterprise applications representing common SaaS platforms used by modern organizations.

Applications include:

- Salesforce
- ServiceNow
- Workday
- Slack
- GitHub Enterprise
- Atlassian Cloud
- HubSpot
- NetSuite
- Figma

### Why It Matters:

Identity Governance programs manage access to business applications. Enterprise applications provide the resources that users ultimately request, review, and receive through governance processes.

### Evidence:

The screenshot shows:

- 9 enterprise applications
- Active application objects
- Business-critical SaaS platforms
- Application inventory ready for governance controls

## 5. Access Matrix

| Group                | Business Purpose          | Applications             |
|----------------------|---------------------------|--------------------------|
| All Employees        | Baseline employee access  | Slack                    |
| HR Team              | HR operations             | Workday                  |
| Finance Team         | Finance and payroll       | NetSuite, Workday        |
| IT Team              | IT operations             | ServiceNow               |
| IT Admins            | Privileged IT access      | Azure Portal, ServiceNow |
| Engineering Team     | Software delivery         | GitHub, Atlassian        |
| GitHub Developers    | Code repository access    | GitHub Enterprise        |
| Marketing Team       | Marketing tools           | HubSpot, Figma           |
| Sales Team           | Sales tools               | Salesforce, HubSpot      |
| Contractors          | Temporary external access | Role-dependent           |
| Executive Leadership | Leadership access         | Slack, Workday           |

## 6. Governance Notes

The environment was designed to support least privilege, role-based access, and future governance workflows. Contractors were intentionally assigned to both the Contractors group and business-function groups to support realistic access review scenarios.

### Example:

Ryan Foster = Contractor + IT Team

Nora Peterson = Contractor + Marketing Team

Avery Simmons = Contractor + Finance Team

## 7. Validation Results

| Validation Item               | Result |
|-------------------------------|--------|
| Tenant created                | Passed |
| Users created                 | Passed |
| Groups created                | Passed |
| Users assigned to groups      | Passed |
| Enterprise applications added | Passed |
| Identity attributes populated | Passed |
| Governance-ready structure    | Passed |

### Phase 1 Outcome

Successfully established the foundational identity architecture for GHOSTD Corporation within Microsoft Entra ID. The environment includes a populated workforce directory, role-based security group structure, enterprise application inventory, user identity attributes, and access assignments required to support future Identity Governance capabilities including:

- Dynamic Groups
- Access Reviews
- Entitlement Management
- Access Packages
- Lifecycle Workflows
- Privileged Identity Management (PIM)

This foundation simulates a real-world enterprise IAM environment and provides the baseline required for governance automation and access lifecycle management.
