

GHOSTD Corporation Identity Governance Program – Phase 2 Joiner Process

1. Executive Summary

This phase demonstrates the Joiner process within the GHOSTD Corporation Identity Governance Program.

A new employee, Candace Jones, was onboarded as a Software Engineer within the Engineering department. Identity attributes including department, job title, manager, and employment type were established to support role-based access decisions.

Access provisioning was performed according to the organization's access model. Candace was assigned baseline organizational access, department-specific access, role-based access, and required business applications. Group memberships and application assignments were validated to confirm that all requested access was successfully granted.

This phase demonstrates core Identity and Access Management (IAM) functions including identity creation, role-based access control (RBAC), access provisioning, application assignment, and access validation. The objective was to ensure that the employee received the correct level of access on the first day of employment while adhering to the principle of least privilege.

Result: All required access was successfully provisioned and verified with no exceptions identified.

2. Business Requirement

New Hire: Candace Jones

Attribute	Value
Name	Candace Jones
Department	Engineering
Title	Software Engineer
Employee Type	Full-Time
Manager	Mia Carter
Location	Remote

Required Access

Access Type	Assignment
Baseline	All Employees
Department	Engineering Team
Role	GitHub Developers
Applications	Slack, GitHub Enterprise, Atlassian Cloud

3. Scope Completed

Area	Completed
User Account Creation	Yes
Group Assignment	Yes
Application Provisioning	Yes
Access Validation	Yes
Joiner Documentation	Yes

4. Implementation Steps

Step 1 — Create Candace Jones Profile

Microsoft Entra admin center

What Was Done:

Created a new employee record for Candace Jones as a Software Engineer.

Why It Matters:

Identity Governance begins when a new identity enters the organization. Accurate attributes drive automated access decisions.

Evidence:

Screenshot showing Candace Jones user profile.

Step 2 — Assign Baseline Access

What Was Done:

Assigned Candace Jones to required business groups.

Why It Matters:

RBAC ensures access is granted according to business function rather than individual assignment.

Evidence:

Group membership screenshot.

Step 3 — Validate Application Access

Group assignment unavailable due to licensing constraints. Direct assignments used to simulate production access validation.

What Was Done:

Assigned Candace Jones to the applications required for the Software Engineer role:

- GitHub Enterprise
- Atlassian Cloud (Jira)
- Slack

Why It Matters:

Joiner processes must ensure new employees receive the applications necessary to perform their job responsibilities. Access was granted according to the Engineering role access model defined in the Access Matrix.

Evidence:

Screenshot showing Candace Jones with direct assignments to:

- GitHub Enterprise
- Slack
- Atlassian Cloud

Validation confirmed all required applications were provisioned successfully.

Step 4 — Record Joiner Result

Access Type	Requested	Granted	Verified
All Employees	Yes	Yes	Yes
Engineering Team	Yes	Yes	Yes
GitHub Developers	Yes	Yes	Yes
GitHub Enterprise	Yes	Yes	Yes
Slack	Yes	Yes	Yes
Atlassian Cloud	Yes	Yes	Yes

Phase 2 Outcome

Result: Successful

Candace Jones was provisioned according to the Engineering access model.

Access Granted:

- All Employees
- Engineering Team
- GitHub Developers
- GitHub Enterprise
- Slack
- Atlassian Cloud

No provisioning exceptions identified. Access was granted using the principle of least privilege and validated against the approved access matrix.
